The length-weight regression for *Evadne spinifera* published in Catalán *et al.* 2007 (*Sci. Mar.*, 71(2): 349) was wrong in the intercept. The correct values for the equation are:

$$\text{Log}_{10} \text{DW} = -10.362 (\pm 2.129, \text{SE}) + 3.741 (\pm 0.751, \text{SE}) \log_{10} L; p < 0.05, r^2_{\text{Adj.}} = 0.856$$

Where DW is dry weight ( $\mu\text{g}$ ), SE is standard error and L is body length ( $\mu\text{m}$ ).
